

The Family of Humanity

We believe in the Family of Humanity. Science shows us that every human being on this planet is a close relative.

- All humans share more than 99% of the same DNA.
- We are a single species with common ancestors within the last 200,000 years.
- All life on Earth is related, from viruses and bacteria to plants and animals.
- Life most likely arose only once on this planet, as evidenced by shared biological building blocks.

We live in a Universe approximately 13.8 billion years old, on a planet about 4.5 billion years old. This shared origin binds us not only to one another, but to all life.
